Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Diotogystem I protein psal - Synechococcus sp.

NiAlternate names: photosystem I chain VIII
C;Species: Synechococcus sp.
C;Species: Synechococcus sp.
C;Accession: S22210
R;Muchlenhoff, U.; Haehnel, W.; Witt, H.T.; Herrmann, R.G.
submitted to the EMBL Data Library, January 1992
A;Description: Genes encoding ten subunits of photosystem I from the thermophilic cyanoba A;Reference number: S18970
A;Reference number: S18970
A;Molecule type: DNA
A;Residues: 1-38 <AUL>A;Residues: 1-38 <AUL>A;Residues: 1-38 <AUL>A;Coss-references: EMBL:X63763; NID:g47585; PIDN:CAA45297.1; PID:g47588

G97910

hypothetical protein spr0311 [imported] - Streptococcus pneumoniae (strain R6)

C;Species: Streptococcus pneumoniae

C;Species: Streptococcus pneumoniae

C;Species: Streptococcus pneumoniae

C;Accession: G97910

TISSUE SPECIFICITY: Widely expressed. Found in the retina.
DISEASE: Defects in USH1A are the cause of Usher syndrome type 3 (USH3) [MIM:276902]. Usher syndrome is an autosomal recessive condition, characterized by the association of retinitis pigmentosa with sensorineural deafness. Patients with USH3 have progressive hearing loss, variably present vestibular dysfunction and adult onset retinitis pigmentosa. USH3 is a common form of USher syndrome in Finland, where it accounts for 42% of all Usher
                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEQUENCE FROM N.A. The Separation of the second of the seco

interactions. Disclosure, SEQ ID NO 35952, 21pp + Sequence Listing, English. The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLi6175) and the encoded proteins (ABB57737-ABB57072). The sequence act for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a protein (ABPD5413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the proteins have antibacterial and antiinflammatory activity. (1), nucleic acids encoding (1), ABN6604-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a compound binds to composition comprising (1) or a nucleic acid encoding (1), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (1) may be used to recombinantly produce (1) and may be used in gene therapy. Antibodies to (1) are used for affinity of the contraction of the composition of the state of the complement of the composition of the compinantly produce (1) and may be chromatography, immunoassays, and distinguishing/identifying

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (51), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6604-ABN71526 and contibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Concleic acids encoding (I) are used to detect Streptococcus in a long of the treatment or prevention or disease caused by concoccus that is used to detect Streptococcus in a vaccine or diagnostic composition. The disease caused by cused as a vaccine or diagnostic composition. The disease caused by cused as a vaccine or diagnostic composition. The disease caused by cused in gene therapy. Antibodies to (I) are used for affinity acid encoding (I) may be used to recombinantly produce (I) and may be consequently, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

ANUAGOZ-AAU14794 represent novel bone marrow polypeptides of the invention. The proteins and corresponding coding sequences may be used in the prevention, diagnosis and treatment of diseases associated with the creased expression by rectifying mutations or disorders associated with decreased expression by rectifying mutations or disorders associated with decreased expression by rectifying mutations or complete by expressing inactive proteins or to supplement the polypeptides by expressing inactive proteins or to supplement the caids may be used to produce the polypeptides, by inserting the nucleic acids and its complementary sequences may also be used as DNA conclet and its complementary sequences may also be used as DNA conclet and its complementary sequences may also be used as DNA conclet and its complementary sequences may also be used as DNA conclet and its complementary sequences may also be used as antigens in the production of antibodies against bone marrow proteins and its mamples, and therefore which patients antibone marrow protein antibodies and antisodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity. The antibodies may also be used to down regulate expression and activity, and consequently in the treatment of may eveloid or lymph cell disorders; in tissue regeneration, such as wound healing; as a nutritional supplement; and in treatment of immune disorders such as severe combined immunodeficiency (SCID)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding bone marrow polypeptides, useful in diagnostic and

The invention relates to identifying a subject at risk for a disease of the heart and involves quantitating the amount of at least one RNA or a polypeptide in the heart tissue or serum of the blood of the subject. The DNA, polypeptides, compounds identified by the methods above, the refined or modified compounds, and the monoclonal antibodies are useful for manufacturing a pharmaceutical composition for preventing or treating cor modified composude, e.g. congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, ischemic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders, syncope and sudden cath, coronary heart disease, ystemic arterial hypertension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease or endocarditis. Transgenic animals are useful for developing medicaments for treating heart congenicate methods are useful for identifying a subject at risk for a heart disease. The methods are useful for identifying a subject at risk for a chart disease. Sequences ABP71501-510 represent specific examples of polypeptides that can be quantitated using the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying a subject at risk for a disease of the heart, comprises quantitating the amount of at least one RNA or a polypeptide in the heart tissue or serum of the blood of the subject.

AAF22316 to AAF22363 encode the human secreted proteins given in AAB63049

to AAB63096. AAB63097 to AAB63132 represent more human secreted proteins

and polypeptides homologous to them. Human secreted proteins have

activities based on the tissues and cells the genes are expressed in.

Examples of activities include: immunosuppressive; antiarthritic;

antirheumatic; antiproliferative; cytostatic; cardiant; vasotropic;

cerebroprorecetive; noctropic; meuroprotective; antibacterial; virucide;

fungicide; ophthalmological; and vulnerary. The polynuclectides and

cropretine can be used to prevent, treat or ameliorate a medical condition

cropretine can be used to prevent, treat or ameliorate a medical condition

cropretine can be used to prevent, oreses, cats, dogs, chickens or

sheep. They are also used in diagnosing a pathological condition or

susceptibility to a pathological condition. Disorders which are diagnosed

or treated include autoimmune diseases e.g. thematoid arthritis,

hyperproliferative disorders e.g. neoplasms of the breat or liver,

cardiovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g.

Alzhaimer's disease, infections caused by bacteria, viruses and fungi and

coular disease, infections caused by bacteria, viruses and fungi and

coular disease, infections caused by bacteria, viruses and incenting cell culture of primary tissues, to regenerate tissues and in

croplasms. The polypeptides can also be used as a food additive or

chemotaxis. The polypeptides can also be used as a food additive or

chemotaxis. The polypeptides can also be used as a food additive or

clipid, protein, carbohydrate, vitamins, minerals, cofactors and other

culticional components. AAP22315 and AAB63048 represent

consular disorders. Alfamines where and the present invention

Sequences ABB94017-94095 represent the amino acid sequences of 79 human secreted proteins encoded by the genes ABL92336-92393. The genes and secreted proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic arids, proteins, antibodies and (ant)agonists are useful in the adiagnosis, proteins, antibodies and (ant)agonists are useful in the cliamosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune hamolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, antiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f)

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HAS). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, disostive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63326-ABG65518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.
                                                                                                                                                                                                                                                         Albumin fusion protein; therapeutic protein X; human albumin; HA; human serum albumin; HSA; cancer; reproductive disorder; digestive disorder; immune disorder; endocrine disorder;

cereted proteins encoded by the genes ABL9236-92393. The genes and conditions, e.g. by protein ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis, (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) infectious diseases such as viral, bacterial, fungal and parasitic infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

ö The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum ablumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haemacopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis).                                                                                                                                                                                                                                                                                                                                                                                                                                      Cancer-associated nucleic acid molecules (N) and proteins (P), where the cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps, by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the present invention. N.B. percreted proteins encoded by the genes ABL92336-92393. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Adabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as wyocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic
                                                        Cytostatic; immunosuppressive; nootropic; neuroprotective; antiviral; antiallergic; heparotropic; antidiabetic; antiinflammatory; antiulcer; vulnerary; anticonvulsant; antibacterial; antifungal; antiparasitic; cardiant; gene therapy; cancer; immune disorder; cardiovascular disorder; neurological disease; infection; human; secreted protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequences ABB94017-94095 represent the amino acid sequences of 79 human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vitro/in vitro activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders (agestive disorders (e.g. Crohn's disease, ulcerative colitis), immune disorders (e.g. diabetes), hemaeutopoietic disorders, neural disorders (e.g. Alzheimer's, Parkinson's, Creutzfeldt-Jacob disease, encephalomyelitis, meningitis, schizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABGG3326-ABGG5518 represent albumin fusion proteins of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New fusion protein for treating disease e.g. diabetes comprises an albumin fused to a therapeutic protein.
           digestive disorder; immune disorder; endocrine disorder; haematopoietic disorder; neural disorder; connective disorder; cytostatic; antiinfertility; antiinflammatory; antiulcer; immunomodulator; anti-HIV; antidiabetic; haemostatic; nootropic; neuroprotective; antiparkinsonian; antimicrobial; neuroleptic; osteopathic; antiarthritic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              54.3%; Score 19; DB 5; Length 461; 30.8%; Pred. lime present interitorial describes primer; sees from synchronic length cDNAs defined in the specification. Where a primer set comprises:

(a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polyuncleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprising a sequence complementary to the complementary strand of a polyuncleotide complement or the complementary strand of a polyuncleotide which comprises a 3'-end sequence and an oligonucleotide which comprises a 3'-end sequence, where the oligonucleotide which comprises a 1'-end sequence complementary to a polyuncleotide comprises a 1'-end sequence, where the coligonucleotide comprises a 1'-end sequence with the sequence of 1'-end sequence is selected from those defined in the specification. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primer sets can be used in antisense therapy and in gene therapy. The primer sets allow obtaining of the full-length cDNAs. The primers are also useful for the confidence of the full-length cDNAs. The primers allow obtaining of the full-length cDNAs easily without any specialised methods. AAH03165 to AAH13632 represent thuman maino acid sequences; and AAH13632 to AAH13632 represent coligonucleotides, all of which are used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                               Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes primer sets for synthesising 5602 full-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 29254, Application US/09252991A
Patent No. 6551795
GENERAL INFORMATION:
APPLICANT: Marc J. Rubenfield et al.
TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS
TITLE OF INVENTION: AERGINOSA FOR DIAGNOSTICS AND THERAPEUTICS
FILE REPERENCE: 107196-136
CURRENT PILICATION NUMBER: US/09/252,991A
CURRENT PAPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/074,788
PRIOR APPLICATION NUMBER: US 60/094,190
PRIOR APPLICATION NUMBER: US 60/094,190
NINGER OF SEQ ID NOS: 33142
SEQ ID NOS: 33142

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                            October 5, 2004, 16:12:48; Search time 77.1507 Seconds (without alignments) 66.737 Million cell updates/sec
